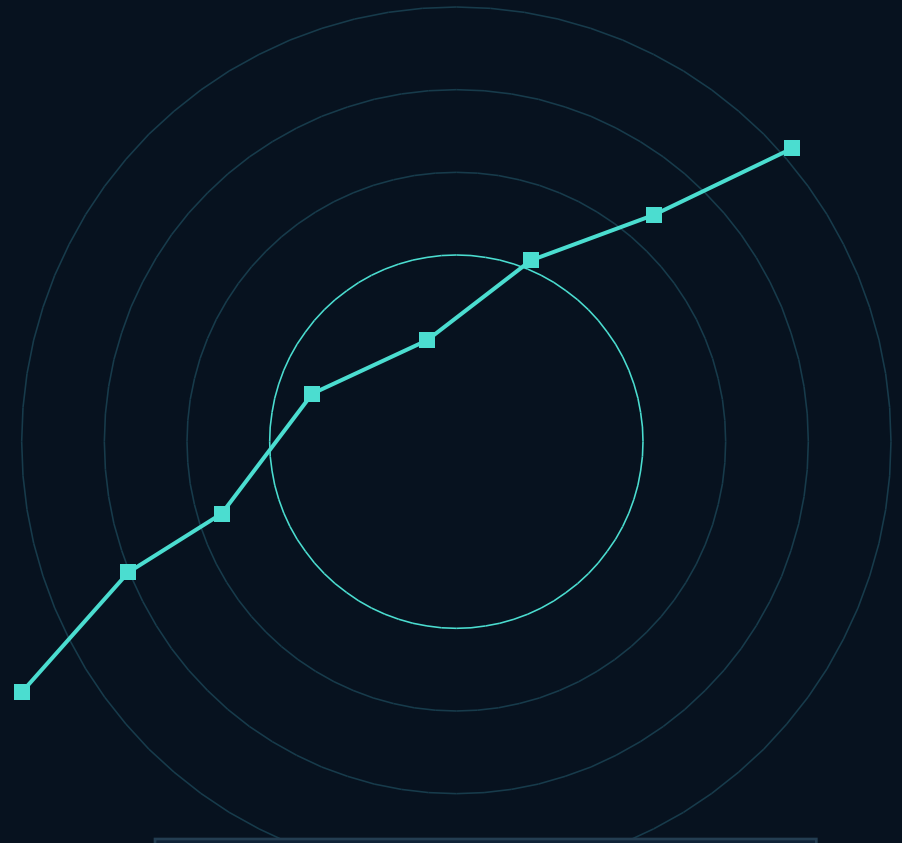
Q QUANTUM QLi

METEORA DBC HACKATHON

Quantum liquidity, under control.

> Verifiable intelligence and wallet-controlled execution for Meteora Dynamic Bonding Curves.



DBC / REVIEWED EXECUTION

CRYPTO WORLD’S FAIR / OCTOBER 2026

Liquidity execution lacks a unified proof trail.

Launch configuration, risk assessment, and transaction approval are distinct operational decisions.

01

CONFIGURATION

Curve, fees, migration and quote assets introduce coupled settings.

02

AUTHORIZATION

Wallet prompts alone are not a durable record of reviewed intent.

03

OBSERVABILITY

AI outputs, RPC reads and confirmed chain data carry different trust levels.

THE GAP: AN INSPECTABLE PATH FROM LAUNCH INTENT TO CHAIN-CONFIRMED STATE.

One deliberate launch sequence.

Seven-stage intent preparation before any wallet signature.

01	02	03	04	05	06	07
ASSET	CURVE	FEES	MIGRATION	QUOTE	FIRST BUY	REVIEW

QLi / LAUNCH FORGE

REVIEW FINGERPRINT

Frozen parameters; network and account checks.

WALLET AUTHORITY

Explicit approval. No custodial signing key.

CONFIRMED RESULT

Submit, confirm and re-read chain accounts.

SCOPE: Unsupported advanced wizard settings are blocked rather than silently omitted.

SDK-backed construction. Wallet-owned execution.

Meteora Dynamic Bonding Curve SDK drives config and pool transaction construction.

01	**VALIDATE**	Genesis, quote mint, DBC program and metadata.
02	**BUILD**	createConfigAndPool; fresh session keys.
03	**REVIEW**	Frozen intent, signer set and spend estimate.
04	**AUTHORIZE**	User wallet approval and signed-byte verification.
05	**CONFIRM**	Preflight, one-time send and owner re-read.

TRANSACTION SCOPE

Wrapped SOL

DAMM v2 migration

SDK 1.5.13

LOCAL VALIDATOR: PASSED

No funded public devnet or mainnet launch is claimed in the verified evidence.

Inference is advisory. Verification is mandatory.

Read-only analysis uses sanitized numerical evidence from creator-verified pools.

OBSERVED POOL

E1-E7 numeric facts

DETERMINISTIC

Always-on analysis

HUGGING FACE

Optional hosted model

VALIDATED OUTPUT

Schema and citations

ENFORCED BOUNDARIES

Server-only token / allowlisted models / explicit consent / request quotas. Schema rejection, deterministic fallback and no AI signing or broadcasting.

LIVE STATUS

HF_TOKEN not configured. Live hosted inference has not been independently verified.

Call quotas are not monetary caps; a provider-level account spending limit is required.

Post-quantum tooling without overclaiming.

Local cryptographic operations plus reference WOTS / Merkle identity proofs.

ML-DSA-65

Digital signatures

SLH-DSA-SHA2-128s

Hash-based signatures

ML-KEM-768

Key encapsulation

WOTS / MERKLE

Reference identity proof

BOUND INTENT

Application-level policy

WALLET REVIEW

Ed25519 signature

IMPORTANT: Local PQ cryptography does not make Solana’s Ed25519 wallet signatures quantum-resistant.

Quantum Vault is unaudited and not deployed to public networks.

What is tested. What is still to prove.

Separate local engineering validation from publicly demonstrated deployments.

VERIFIED IN DEVELOPMENT

- Cloned-program local validator: DBC config and pool confirmed.
- SDK public RPC dry-run preflight checks.
- Wallet-rejection and tampered-byte negative cases.
- Stale-blockhash refusal and ownership readback.
- Local launch test spent approximately 0.033 SOL.

REQUIRES PUBLIC VALIDATION

- Real Phantom extension and mobile end-to-end.
- Funded public devnet launch and transaction proof.
- Funded mainnet launch with explicit wallet approval.
- Hugging Face live inference; HF_TOKEN absent.
- Deployed and audited post-quantum vault verifier.

An inspectable liquidity stack, built around DBC.

Next milestones are measurable, not speculative.

01 VALIDATE

Funded public devnet transaction, physical Phantom and browser E2E video.

02 VERIFY

Publish transaction signatures, confirmation and account ownership evidence.

03 EXPAND

Configure hosted inference and publish validated model provenance.

PUBLIC CODE **github.com/QuantumQLi/QLi**

x.com/QuantumQLi

Development-stage submission. No unverified public mainnet launch is claimed.
